

Garland Tool tutorial

Decoration data asset

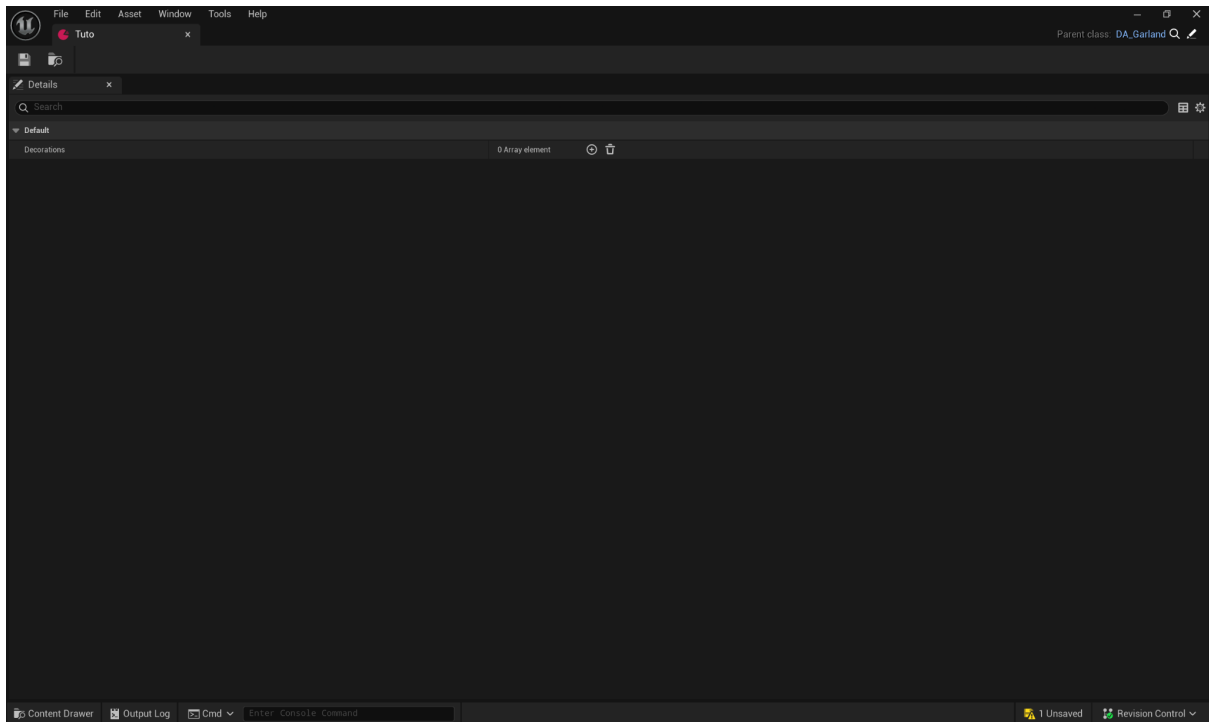

Creation

Create a **DA_Garland** DataAsset

Description

The data asset represents a garland consisting of an array of decorations (a series of meshes along the garland).

Each decoration contains:

- an ID
- a start offset
- an end offset
- a spawn interval for the meshes
- a list of meshes to spawn
- the base transform to apply to these meshes (for example, a Z-offset so they don't clip into the garland, or a smaller scale so they aren't too big). **i The scale is uniform; only the X axis will be taken into account**
- the transformRandom to be applied to each of the meshes to add randomness **i The scale is uniform; only the X axis will be taken into account**

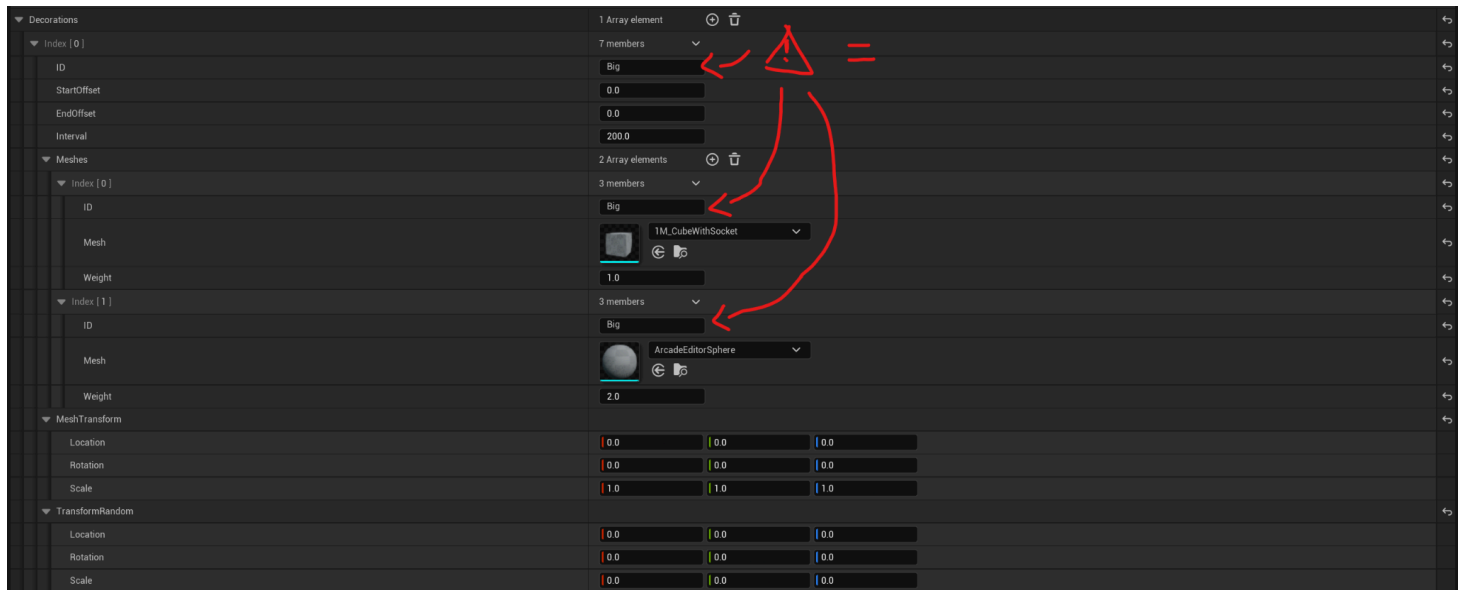

! The order of the decorations matters; the first one will take priority over the others when spawning. It is therefore recommended to place the largest and most widely spaced decorations at the top of the list. !

Decorations	1 Array element	
Index [0]	7 members	
ID	None	
StartOffset	0.0	
EndOffset	0.0	
Interval	200.0	
Meshes	0 Array element	
MeshTransform		
Location	0.0 0.0 0.0	
Rotation	0.0 0.0 0.0	
Scale	1.0 1.0 1.0	
TransformRandom		
Location	0.0 0.0 0.0	
Rotation	0.0 0.0 0.0	
Scale	0.0 0.0 0.0	

Each mesh has:

- an ID
- a mesh
- a weight that determines its chances of spawning compared to others (higher weight = greater chance)

 **IT IS ESSENTIAL THAT THE MESH'S ID MATCHES ITS DECORATION, OTHERWISE IT WILL NOT SPAWN CORRECTLY** 

 You can find presets examples in Plugins/GarlandTool/Content/DataAssets

The tool

To use the tool, go to the “scriptable tools” section of the editor

The tool has several settings:

- the mesh used to generate the string
- the data asset used for the decorations
- the height at which the garland hangs
- the colour of the debug line
- the thickness of the debug line

Once the settings have been adjusted, all you need to do is drag and drop it into the scene and the garland will spawn as shown.
